99% Pure trans-Pterostilbene

pTeroPure is a nature identical form of trans-Pterostilbene
Introduction

pTeroPure will promote health and well-being through the discovery and development of nutraceutical ingredients - naturally occurring molecules that can be integrated into dietary supplements, nutritional products and functional foods.

Like resveratrol, pterostilbene (tero-STILL-bean) belongs to a class of compounds called phytoalexins, which are naturally produced by plants when under attack by pathogens such as bacteria or fungi. Pterostilbene and resveratrol have very similar pharmacologic properties, however Pterostilbene has several key advantages over resveratrol.¹,⁶ Pterostilbene is one of several stilbenes found in certain berries (e.g., blueberries, cranberries, sparkleberries, lingonberries, and grapes), thus, consumption of these small fruits may help improve health.¹,⁴

pTeroPure is a nature identical form of trans-Pterostilbene. Pterostilbene is the next generation of resveratrol:

- a methylated resveratrol analog naturally found in berries
- superior biological activity
- better oral bioavailability
- metabolizes more slowly in the body, allowing more time for its antioxidant activities to act

“The more we study Pterostilbene, the more we see its huge potential in the human health field.”
- Dr. Agnes Rimando, USDA ARS¹

Phytochemical Profile of Pterostilbene

Structure

![Chemical Structure of Pterostilbene]

CAS#: 537-42-8
Molecular Weight: 256.299
Molecular Formula: \( \text{C}_{16}\text{H}_{16}\text{O}_{3} \)
Other Names:
- Methylated Resveratrol
- Dimethoxyresveratrol
- 3',5'-Dimethoxy-4-stilbenol
- 3,5-Dimethoxy-4'-hydroxy-trans-stilbene
- 4-(2-(3,5-Dimethoxyphenyl)ethenyl)phenol

Why is Pterostilbene better than Resveratrol

Pterostilbene (methylated resveratrol) has greatly improved oral adsorption and metabolic stability. The enhanced activity of Pterostilbene compared to resveratrol may, in part, be explained by structural differences. Pterostilbene with two methoxy groups and one hydroxyl group has improved lipophilicity and a higher potential for cellular uptake than resveratrol, which has three hydroxyl groups.3

Several published studies refer to Pterostilbene as having better activity than resveratrol. For example, the result of one study indicates that pterostilbene is more effective than resveratrol as an inhibitor of DNA synthesis in the human adenocarcinoma HT-29 cell line.3 Additionally, Rimando et al. have shown that unlike the related stilbenes resveratrol, piceatannol, or resveratrol trimethyl ether, Pterostilbene is a potent peroxisome proliferator-activated receptor alpha agonist, lowering lipid levels in the blood stream at higher rate than even ciprofibrate.7
How Pterostilbene and Resveratrol Work Together

Pterostilbene and resveratrol, both stilbene compounds, have very similar pharmacologic properties, but published data suggests that they act very differently. All of the bioassay and animal data, as summarized above, suggests that Pterostilbene is the most potent stilbene, following a different mechanism of action than resveratrol. However, researchers have suggested that these two compounds also work synergistically, supporting the theory that a combination of Pterostilbene and resveratrol in a formulation maybe more effective than using these ingredients separately.

“Pterostilbene showed strong inhibitory activity - much more than resveratrol - against a particular form of cytochrome P450.”

-Dr. Agnes Rimando, USDA ARS

Potential Health Benefits of Pterostilbene

- Strong antioxidant
- May be a potent anti-aging compound
- Potent anti-inflammatory activity
- Prevents neuro-degeneration
- Prevents damage of oxidative stress
- Mimics calorie restriction
- Improves heart health
- Can be used to maintain healthy cholesterol levels
- Orally active and works to decrease plasma glucose levels in some animals
- Identified as an antiviral compound with broad target specificity
- Inhibits expression of certain inflammation-related genes in the colon
- Potential for cancer chemo-prevention
What is the Significance of Sirtuins

The sirtuins are a family of seven enzymes (SIRT1-7) with the potential to protect against diseases such as hypertension and cancer. David Sinclair, Ph.D., Harvard Medical School, and Leonard Guarente, Ph.D., Massachusetts Institute of Technology, found that calorie restriction activates SIRT1, one of the key enzymes of the sirtuin family. Both Pterostilbene and Resveratrol improve mitochondrial function and protect against metabolic disease by activating SIRT1 and mimicking calorie restriction.

**STORAGE CONDITIONS**

**STORAGE**
Room Temperature in a dry place.

**EXPIRATION DATE**
01/20XX under the above conditions.
Intellectual Property

pTeroPure is a licensee of two U.S. patents from the USDA-ARS and the University of Mississippi and is working on the third patent with a strategic partner.

Patent Pending #1: “Pterostilbene as a New Agonist for the Peroxisome Proliferator-Activated Receptor Alpha Isoform.”

Patent Pending #2: “Method to Ameliorate Oxidative Stress and Improve Working Memory via Pterostilbene Administration.”

Patent Pending #3: “A Key Intermediate for the Preparation of Stilbenes”

The pterostilbene products developed by pTeroPure will be based on the technologies licensed from the USDA ARS and the University of Mississippi.
